### Overview

- Goals
- Cluster Basics
  - Recap
  - Basic Tools
  - Advanced Tools
  - Revisting the Datafile

Log into the cluster

- Log into the cluster
- Learn some basic commands

- Log into the cluster
- Learn some basic commands
  - sort, uniq, cut, nano

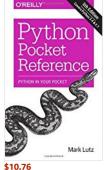

- Log into the cluster
- Learn some basic commands
  - sort, uniq, cut, nano
- Learn some advanced commands

- Log into the cluster
- Learn some basic commands
  - sort, uniq, cut, nano
- Learn some advanced commands
  - grep, sed, awk

- Log into the cluster
- Learn some basic commands
  - sort, uniq, cut, nano
- Learn some advanced commands
  - grep, sed, awk
- Answer some Emmy trivia questions

### More Twitter

## Logging On

- Use command "ssh"
- Logs on to one of two compute nodes:

```
ssh <netid>@dscr-slogin-01.oit.duke.edu
```

- Your terminal window is now on the computer "dscr-slogin-01.oit.duke.edu"
- You may have set up an alias:

```
alias DSCR="ssh <your netid>@dscr-slogin-01.oit.duke.edu"
```

### File Generation

- nano text-based text editor
- Adding a filename "nano <file>" opens that file

And use scp to move it up to the cluster

### File Generation

- nano text-based text editor
- Adding a filename "nano <file>" opens that file
- Or make a file on your local computer
- And use scp to move it up to the cluster

## Tips and Help

- Spaces and order matter
- General grammar rules:

```
<command> <flags> <input>
```

- If you're unsure what the flags are "-h" or "-help" often works
- Using "tab" auto-completes filenames and commands
- Prevents typos

Ta-Da!! Now you can run a job on the cluster!

- Ta-Da!! Now you can run a job on the cluster!
- You now have the minimum knowledge to get onto the cluster and use the resource to run software that is unsuitable for your laptop

- Ta-Da!! Now you can run a job on the cluster!
- You now have the minimum knowledge to get onto the cluster and use the resource to run software that is unsuitable for your laptop
- Now, there are a lot more things that the cluster and bash can do, mostly involving data manipulation

- Ta-Da!! Now you can run a job on the cluster!
- You now have the minimum knowledge to get onto the cluster and use the resource to run software that is unsuitable for your laptop
- Now, there are a lot more things that the cluster and bash can do, mostly involving data manipulation
- Let's delve into some of those!

### Datafile

- Emmy Winners 1949 to Present
  - /work/cc216/490S/cc216/emmy-awards-1949-2017.csv
- Copy to your own folder, then pull out the nominees

```
grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
Nonfiction,//g' | cut -d, -f4 > nominees.list
grep ^20.., emmy-awards-1949-2017.csv | sed 's/, Nonfiction,//g' | cut -d, -f4 > nominees.list
```

### Tools

- Input and output from commandline
  - Using > and |
- cat, less, head, tail inspecting files and output
- sort sorting
- uniq sort and eliminate duplicates
- cut split a file into columns

## Input and Output

- Unless otherwise noted:
  - Input comes after the command
  - Output "prints to screen"
- Using > and | changes that
- > takes output and (over)writes to a file

```
ls > list.txt
```

If you use double >> it appends to a file

```
ls -lt >> list.txt
```

## Input and Output

- Using | changes input
- I takes output and passes it to the next command

#### ls | head -n1

 You can string together many |'s to perform complicated actions

## **Inspecting Files and Output**

- cat, less, head, tail
- cat prints the whole file to screen

#### cat <name of file>

- less opens the file so you can scroll through it (q to quit)
- head, tail return the first or last 10 lines of a file

#### head <name of file>; tail <name of file>

- Common flags:
  - -n number of lines (overrides 10)

### sort

sort takes input and sorts it! (simple, right?)

```
sort <name of file>
cat <name of file> | sort
```

- Common flags:
  - -n sorts numerically
  - -u sorts and only presents unique hits
  - -r sorts reverse
  - t, and -k sort the nth field (k), separated by ,

## uniq

 uniq takes input and removes adjacent duplicates! (still simple, right?)

```
uniq <name of file>
cat <name of file> | uniq
```

- Common flags:
  - -c counts each unique line
  - -d reverses the meaning (prints only duplicates)

### cut

cut takes input and divides it into "columns"

```
cut -d<what to divide by> -f<which columns
you want> <name of file>
```

- Common flags:
  - -d what to divide by ("," " "tab")
  - -c take n characters (-c1-10 takes first 10 characters in each line)
  - -f which columns you want:
    - -f1, first only
    - -f1-5 one through five
    - -f1,5 first and fifth only

### Advanced Tools

- The following tools are more advanced and complicated
- You will often see them in online forums
- You don't have to be a wizard
- It is good to be familiar with them

(Once you are, there isn't a dataset you won't be able to manage)

- grep regular expression search
- sed search and replace patterns
- awk counting as well as search

### grep

- grep searches, line by line, for a pattern or "regular expression"
- Globally search a Regular Expression and Print

grep <pattern to find> <name of file>

- Common flags:
  - -i case-independent
  - -v reverse-search (all lines WITHOUT the pattern)
  - -c returns a count instead of the lines
  - -w surround the pattern with whitespace
  - -A or -B return pattern and n-lines after (A) or before
     (B)

### sed

- sed searches and replaces a pattern
- Prints result to screen

sed 's, <old pattern>, <new pattern>,g' <name
of file>

- Common flags:
  - -i in-place, replaces the pattern in the file and overwrites
  - -i.bak in-place, same as above but saves the initial as originalfilename.bak

### awk

- awk is very powerful and mysterious
- If I'm using it, it is likely from a google search
- To find the average of the second column:

```
cat <name of file> | awk ' sum += $2 END if
(NR > 0) print sum / NR '
```

- "Add up column 2, if more than 1 row then print the sum divided by the rows"
- Great for advanced math (bash can, generally, only handle integers)

- Emmy Winners 1949 to Present
- What did these commands do?

```
grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
Nonfiction,//g' | cut -d, -f4 > nominees.list
```

```
grep -
| -
sed -
cut -
```

grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
Nonfiction,//g' | cut -d, -f4 > nominees.list

- grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
  Nonfiction,//g' | cut -d, -f4 > nominees.list
- grep search for 20##, in the Emmys file

- grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
  Nonfiction,//g' | cut -d, -f4 > nominees.list
- grep search for 20##, in the Emmys file
- | take output and feed it to sed

- grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
  Nonfiction,//g' | cut -d, -f4 > nominees.list
- grep search for 20##, in the Emmys file
- | take output and feed it to sed
- sed replace ", Nonfiction," with ""

- grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
  Nonfiction,//g' | cut -d, -f4 > nominees.list
- grep search for 20##, in the Emmys file
- I take output and feed it to sed
- sed replace ", Nonfiction," with ""
- cut pull out the 4th column, by commas

- grep ^20.., emmy-awards-1949-2017.csv | sed 's/,
  Nonfiction,//g' | cut -d, -f4 > nominees.list
- grep search for 20##, in the Emmys file
- I take output and feed it to sed
- sed replace ", Nonfiction," with ""
- cut pull out the 4th column, by commas
- > write to file named nominees.list

## Answer the following:

How many Emmys was Netflix nominated for in 2015?

How many different shows?

Which show had the most?

How many Emmys has GoT been nominated for?

## Answer the following:

How many Emmys was Netflix nominated for in 2015? (15)

How many different shows? (7)

Which show had the most? (House of Cards - 6)

How many Emmys has GoT been nominated for? (105)
